Hypothesis

Day 0

~~Day 1~~

1. $\frac{dS}{dt} = -0.00125 \times 1995 \times 5 = -12.46875$

$\frac{dI}{dt} = 0.00125 \times 1995 \times 5 - 0.1 \times 5 = 12.46875$

$\frac{dR}{dt} = 0.5$

Around 10 days we will reach the peak, at that time most ~~Suspet~~ susceptible people ~~hads~~ will be infected and unrecovered.

2. Several waves. when added expose, the changes of people might be slower and indirect which leads to several waves.

3. γ. This is because when γ changes, it directly affect the infected people(−) but β affect I indirectly..
